ABOUT THOSE FINE BERWICK BAY OYSTERS.

Did you read our claims as to the Economy, Food Value and Healthfulness of Oysters?

ADAPTABILITY—There are few flesh or meat foods which have the cooking properties which permit of preparation in so many forms as does the Oyster. Whether raw, boiled, fried, baked, roasted, pan-fried or what not, the oyster lends itself equally successfully to the cooks art, and in any one of the methods, or the various recipes employed the result furnishes a tasty, delicious, economical meal.

GOVERNOR WAS NOT ANNOYED ARE GIRLS BECOMING UGLY?

Reason Why Massachusetts Chief Executive Did Not Resent His Being Mistaken for Butler.

Here's a good one that ex-Governor Walsh of Massachusetts told on himself at a dinner given to some of his friends in Washington recently. Some months ago, while he was governor, Mr. Walsh was a guest at a reception given by Mrs. Mabel Hunt Slater in Boston.

The governor arrived late and was not introduced to all of the guests because of their large numbers. Some time in the early hours of the morning Archie Roosevelt approached him and said:

"John, will you please get me a napkin?"

"Certainly," Governor Walsh said, keeping a grave face, "in a minute, sir."

The governor promptly found the napkin for young Roosevelt and smilingly handed it to him. Something in the governor's smile made Roosevelt suspicious. A well-trained butler does not smile.

"Aren't you the butler?" he asked, doubtfully.

"No, my name is Walsh; I am governor of Massachusetts," was the reply.

Roosevelt apologized profusely. "Oh, that's all right," Walsh said. "I can understand your mistake. I frequently have noticed that the butler is the best-looking man in the room at a Back Bay party."—Boston Post.

CELLO PLAYING HARD WORK

Experiments Show That Four Tons of Energy Are Necessary to Play Single Selection.

A simple air played on the violoncello calls for a total expenditure of energy equal to two and three-quarter pounds per note or more than four tons of energy for the single selection, notes Popular Science Monthly. This is vouched for by Prof. Poffenberger of Columbia university, who made some experiments in his laboratory with the aid of the famous Dutch cellist Michael Penha.

A special apparatus is necessary to conduct the tests. Against the surface of a revolving carbon cylinder is suspended a chalk point which is actuated by a slender wire attached to the musician's finger. At each pressure the tension vibrates along the communicating connection and records the energy expended.

At a recent test Michael Penha at times raised the point to a distance equaling three pounds in weight, that being the record of the forefinger. The pressure alone required to produce the characteristically luscious tones of a simple Bach aria averaged two and three-quarter pounds per note. The total energy expended amounted to 9,414 pounds, or more than four tons.

This same amount of energy would be sufficient to carry a laborer through his entire day's work. Yet it took but five minutes for the artist to exert the same amount of force.

War-Time Games in Paris.

Nearly all the kids of 1916 have a father or a brother at the front. They live in an atmosphere of heroism. All the little folks—of the lycées, the common schools, and even of the kindergarten—play soldier in the streets and in the parks. You see them at their war plays such as Willette has pictured at Rue St. Vincent de Paul corner much to our delight. Ingenious plays in which it is hard to take the part of a Boche, and in which justice would demand that each in turn took that detested part—but is there ever any justice, even here?

Ah, the tiny ramparts and trenches that have been built by boys and girls this year on the glistening sands of the beaches, smoothed by the receding tide, only to be leveled when the tide came in!

The girls in these war games usually serve as Red Cross sisters; they care for the wounded and nurse them with jam and make-believe bandages. Or else they are godmothers, writing jolly letters to the brave boys at the front. But there are some, however, who are never satisfied unless they, too, can carry a toy musket and take part in the play-fighting.—Cartoons Magazine.

Shaped Hot-Water Bottle.

Many are the hot-water bottles on the market, but the newest is a peculiar one shaped exactly to the small of the back. It is made of aluminum, and is oval and curved so that it fits either the back or face when one is suffering from neuralgia or toothache. Water can be heated directly in the bottle by using the bottle as a utensil on the stove. It comes fitted with a thick eiderdown cover.

Not So Easy.

"Papa," said little Harry, "if I promise to ask just one more question, will you answer it?"

"Yes, my son. What is the question?"

"What are the boundaries of Romania?"

"The idea of asking such a question. Go look it up in your geography, my boy, and then you'll remember it."

Abundant Home Supply.

"Is Higgins susceptible to battery?" "No. There's no chance for framing up a complaint that his own self-esteem will not have anticipated."

Motive Enough.

"What are the motives of Ringling's new play?" "He needs the money."—Princeton Tiger.

Englishman Makes the Assertion That Beauty Is Fading as One Result of War.

"Women will be not only physical wrecks, but they will become decidedly ugly if they continue to do men's work for an indefinite length of time. They will be unfit heirs to the heritage that will be handed down to them."

The words were spoken with emphasis by a man who should have known what he was talking about.

It must be admitted that the health and beauty of our women are in these troubled times suffering on a colossal scale, but it is the war's strain and not the nature of their work which is causing the mischief. Any work just now must come as a blessing in disguise to the majority of our women. The novelty of the duties of tram guarding, working on the railways, farm laboring and other kindred occupations brings diversion, and in many instances saves the reason of many over-anxious wives, sweethearts and mothers.—London Answers.

FIRST IDEA FOR MOTOR CAR

Invention of Gottlieb Daimler Was the Germ From Which Sprang Present Immense Industry.

Little more than thirty years have passed since Gottlieb Daimler, then a director of the Otto gas engine works, invented the first engine worked by explosions of gas.

It was an engine worked at such unheard-of speed—we are going back to that time in using the epithet—that the heat generated in the working was sufficient to ignite the subsequent charges of gas once the engine had been set running.

In 1886 he mounted this engine on a bicycle, suspending it vertically between the front and the rear wheels, and making it drive the rear wheel by a belt.

In this primitive motorcycle, for such it now appears to us, was embodied the first real germ of the motor car of today.

By-Product Coke Oven.

The iron industry of this country has been adopting the by-product coking process at a marvelous rate. There are practically no by-product coke plants in the United States, which do not recover ammonia, tar and light oil (crude benzol). In the vast majority of the plants also surplus gas is recovered and utilized either at the plant itself or by distribution to outside consumers. There are possibly two or three very small by-product coke plants at which tar and ammonia are not recovered for disposal to the outside markets, but these would certainly represent considerably less than 1 per cent of the total by-product coking capacity. There is not over 5 per cent of the by-product coke oven capacity of the country that is not now equipped with benzol recovery plants, and the by-product coking plants now under construction have either contracted for benzol recovery equipment or indicated a strong probability that such provision will be made.—Metallurgical and Chemical Engineering.

Painter's Frenzy.

The painter-engraver, Alexander Lunois, who has just died, excelled in oriental scenes. He had passed half his life in the lands of the Mussulman. His works were full of light, full of color, full of movement. During his last illness, at Paris, where his elegant apartments looked out upon the quay, he was on his couch burning up with fever. From time to time he threw a glance upon a beautiful Van Dyck. The picture was covered by a glass. Suddenly in the reflections of a glass of water he imagined that he saw in the sparkling light a dance of odalisques, such as in former days he had seen in Constantinople. He could not restrain himself. He leaped from his bed and, all trembling, he seized his palette, his brushes, and frantically set at work upon a marvelous sketch. His wife found him nude save for a slight covering over his shoulders, his eyes sunken, his teeth chattering, painting with the fury of a madman. She led him back to his couch. He died a few days later and the last picture of the great artist remained unfinished.—Le Cri de Paris.

Historic Gate Collapsed.

The massive iron gate forming the chief entrance to the National library in Paris, France, collapsed the other day as the doorkeeper was closing the place for the night. The gate weighs about three tons, and happily for the man and his son who was helping him to shut it, just missed them in its fall. The accident was caused by the top hinge giving way suddenly, and there was a great crash as the portal wrenched itself free and fell heavily into the courtyard. A number of republican guards were called out to keep watch over the entrance, and will remain on duty there until the necessary repairs can be effected. The mishap caused quite a commotion, for everyone thought a bomb had been dropped, so sharp was the report when the gate—a relic of Napoleon's days—struck the ground.

Coincidence, or What?

While bathing at an English south coast resort a young married woman omitted to remove a gold bracelet watch, a gift from her husband, an army doctor. Her plunge into the sea caused the watch to stop, and she learned later that at the precise hour indicated by the stopped hands her husband was drowned while bathing in France.

DIP BATTLE FOR TICKS.

Good Advice From U. S. Department of Agriculture.

Cattle ticks? Dip them. Is blood in your cows and steers going into milk and meat or into ticks? The loss in weight in Southern cattle is evident from the fact that few ticky cattle are fat, practically all being in poor condition when sold at the stock yards.

A ticky steer brings from \$5 to \$10 less than a tick-free steer of the same weight because of the quarantine restrictions and the difference in quality.

Seed ticks hatch out in the ground, then climb up the nearest blade of grass or fence post and bunch near the top until they get a chance to get on a cow or steer. They begin drawing blood at once and, although they are so small at this stage they can scarcely be seen, they nevertheless can give the animal tick fever. In from 21 to 66 days this small seed tick sucks blood enough to become one-half inch in length.

An Oregon power development plant has the world's largest chain drive, eight chains, each 21 inches wide, transmitting 5,000 horsepower.

CLASSIFIED COLUMN

RATES.

One cent per word for first insertion, ½ cent per word for each insertion thereafter; minimum rate, 25 cents. Classified advertisements must be paid cash in advance.

FOR SALE.

FOR SALE—Anything you have for sale can be quickly disposed of by placing an ad in the Daily Eagle Want Column. The price is nominal, too.
